

Week 4 Progress Update

What has been done during the week?

- This week I finished the Firebase Storage connection for the photo feed after finally getting past the storage bucket issue.
- I uploaded test images into Firebase Storage, connected those image URLs back into the app, and got the photo feed showing real Firebase-hosted images instead of placeholder web images.
- I also updated the photo feed, so it reads post content from Firestore instead of only using hardcoded sample posts.

What are you going to do for the next week?

- This week I have been working on my prototype and on my demo.
- I am also continuing to polish the app and make sure the main features are working the way they should.
- I plan to keep organizing screenshots and written documentation for the capstone as I finish things up.

Are there any issues?

- At this point, I do not have any major issues.

Are you on schedule, ahead of schedule, or behind schedule? If behind, what is the plan to catch up?

- I am on schedule with the capstone and behind on the prototype and demo.
- My plan now is to stay focused on the prototype, demo, testing, and final polishing so I can have everything ready by Saturday.
