

Discussion 1: Why PHP?

Many people side with PHP, while others don't. For example, the developer of DokuWiki, Andreas Gohr, believes that PHP's performance and versatility make it a valuable tool for various web projects. While people like Gohr speak on PHP in significant ways, there are people like Yukihiro Matsumoto (Matz). Norvig has highlighted PHP's weak typing system and lack of consistency as reasons he prefers Ruby over PHP for web development. As someone who has been dealing with PHP a lot recently, I know that PHP is excellent and stands by it.
