What are the most difficult things in PHP and SQL you find to do?

The most challenging thing I deal with while doing PHP is debugging the code, especially finding errors and bugs in large codebases. SQL is simple, but the biggest problem is the database design. It is vital to design it perfectly for good understanding.

What are the easiest things to do in PHP and SQL?

One of the easiest things in PHP is how beginner-friendly the Syntax is since it's similar to Java, which makes it easier for devs familiar with languages like Java. SQL also has a straightforward syntax, making it easy to learn the basics.

How can you overcome your difficulties?

The best way I can overcome this is repetition. Repetition will make PHP and SQL way more accessible and more understanding for me, making these difficulties not so bad anymore.
