

Project Scope: Outcomes of the Project

The first outcome of this project is to provide a written report, that would provide a number of key details that would explain why this research project is being done. The first part of this report will provide studies about elderly internet users and will provide details on various challenges that internet users in this age range face. With these provided research studies, it will be seen that by finding ways to make the internet more user friendly for elderly internet users, is something that could greatly benefit internet users in this age range. The second part of this report will detail my interviews and observations that was done for this project. By providing direct interviews and observations, it will be proven that in the real world there are real challenges that internet users in this age range face when using this project. Ultimately, with these two parts of the report, it will be seen that the initial proposal for the project is something that could be of great benefit for society as a whole.

The second outcome of this project will be to provide a prototype of the feature that was initially proposed. This prototype will display a number of important features, such as text enlargements and minimalist user interface designs, that would be important to the overall success of this project. With this prototype it will then be hoped that this would be a feature that could then be more fully developed and implemented to the general Internet user in the intended ideographic for which the feature will be intended for.
